

Manual testing

Day-03 Assignment

Different levels of testing:

The levels of testing which are given in below they are given

- Unit testing
- Integration testing
- System testing
- Acceptance testing

Unit Testing:

Unit Testing is the first level of software testing in which individual units or components of an application are tested independently. It is usually performed by developers to verify that each unit works correctly before integration. Detect the defect early , reducing debugging time and development cost.

Integration Testing:

Integration Testing verifies the interaction and data flow between two or more integrated modules. It ensures that combined components communicate

correctly and work together without interface issues.
Integration Testing.

System Testing :

System testing evaluates the complete and integrated software application to verify that it meets all specified functional and non-functional requirements. It is performed in an environment similar to production. Tests the complete application from end to end. Verifies functional and non-functional requirement.

Acceptance Testing:

Acceptance Testing is the final level of software testing, where customers or end users verify that the software meets business requirements and is ready for release. Successful completion indicates that the application is acceptable for production. Validate the software against business and user requirement.
