

Manual testing

Day-09 Assignment

Explain in detail about different defect status:

Introduction

A defect status represents the current stage of a bug during its life cycle. It helps testers, developers, and project managers track the progress of a defect from the time it is reported until it is closed. Proper defect status management ensures that issues are resolved efficiently and software quality is maintained.

Different Defect Status

1. New

- A tester identifies a defect and logs it into the defect tracking tool.
- The defect is waiting for review by the project team.
- At this stage, no action has been taken by the developer.

Example: A login button does not respond when clicked, and the tester reports the issue.

2. Assigned

- The defect is assigned to a developer by the project manager or team lead.
- The developer becomes responsible for analyzing and fixing the issue.

Example: The login button issue is assigned to Developer A.

3. Open

- The developer reviews the defect and begins investigating the root cause.
- The defect is confirmed and is under development for fixing.

Example: The developer identifies that a JavaScript function is missing.

4. Fixed

- The developer has corrected the defect.
- The updated code is sent to the testing team for verification.

Example: The missing JavaScript function is added, and the login button now works.

5. Pending Retest

- The defect fix is available in the latest build.
- The tester is waiting to verify whether the issue has been resolved.

Example: The updated application is ready for testing.

6. Retest

- The tester executes the test cases again.
- The tester verifies whether the defect has been fixed successfully.

Example: The tester clicks the login button to ensure it works correctly.

7. Verified

- The tester confirms that the defect has been fixed.
- No issue is found during retesting.

Example: The login process works correctly without any errors.

8. Reopened

- The defect still exists after the fix.
- The tester changes the status back to the developer for further correction.

Example: The login button works only in Chrome but fails in Firefox.

9. Closed

- The tester confirms that the defect has been fixed and verified.
- No further action is required.

Example: The login button works correctly in all supported browsers, and the defect is closed.
