

Manual testing

Day-04 Assignment

Test Plan and Monitor Activities:

Test plan :

Test plan is the one of the process in test process and a test plan is a detailed document that outlines what to test, how to test it, when testing will happen, and who will do the work. It acts as a clear roadmap for the quality assurance team and other project partners

Key Parts of a Test Plan

- Objectives: The main goals and targets for checking the software.
- Scope: What features will be tested (in-scope) and what will not be tested (out-of-scope).
- Strategy: The methods, tools, and types of tests (like manual or automated) to use.
- Schedule: The timeline, key dates, and deadlines for testing tasks.
- Resources: The team members, hardware, software, and test environment needed.
- Criteria: The rules for when to start (entry) and when to finish (exit) testing.

Monitor Activities:

Activity monitoring is the continuous tracking and recording of digital actions, such as application usage, website visits, and file transfers, to improve productivity, secure data, and maintain compliance.

Key features of Monitoring in software testing

- **App and Web Tracking:** Logs specific programs and websites used during work hours along with duration.
- **Screen Captures:** Takes periodic screenshots or records live screen activity.
- **Keystroke Logging:** Captures keyboard input to spot risky or malicious behavior.
- **File Activity Monitoring:** Tracks files opened, changed, or moved to external drives.
